Subject: new lamprey shocking technique
Date: 10/10/2006 02:04 PM

I spoke to Chris Thompson who clarified for me that the new shocking technique (multiple shocks rather than a single shock) was used for the first time last week at Johnson Creek. He learned for the first time yesterday that the new technique was being used. I think it is very strange that no one at Windward or LWG mentioned to anyone that they were using a new technique. Chris told me that the crew had recovered 4 additional ammocoetes and 1 macrophthalmia today at Location 18 and were on their way to Arkema this afternoon. I just want to reiterate that the Nez Perce Tribe advocates that the sampling continue through at least the end of the week with the new shocking technique. Given the success over the last few days, it appears we could capture enough ammocoetes for at least two, if not three or more, samples in the ISA if the sampling continues. Thanks for your attention to this matter.
